How to install matclipse.

Updated Nov 20, 2011 by [chr.albe](#)

Update site

Add <http://matclipse.eclipselabs.org.codespot.com/git.update/> to the update sites in Help -> Install New Software and install Matclipse. For Windows systems, you need to install the win32 extras too.

IMPORTANT (Linux/MacOS): The Matlab path is not set at the first start, you need to set it in Window->Preferences

From source

The plugins are available in the Git repository: <https://code.google.com/a/eclipselabs.org/p/matclipse/source/checkout>

To build the plugin yourself in Eclipse, you need the Eclipse, the PDE and the EGit plugin, which is available in the update manager. (The Eclipse Classic SDK includes PDE). Then you need to do the following steps:

- 1) Open perspective "Git Repository Exploring" and pull the repository from the URL <https://code.google.com/a/eclipselabs.org/p/matclipse/>
- 2) Open the Java perspective, right click one plugin and click "Run as Eclipse Application"

To run matclipse on win32, you need com.jacob, which is also included in the source repository. This plugin is not necessary on other systems.

You should get a new Eclipse instance with the matclipse plugin running inside.

IMPORTANT (Linux/MacOS): The Matlab path is not set at the first start, you need to set it in Window->Preferences

You can then switch to the Matlab Workbench perspective and start working!

For instructions how to include a plugin into the running Eclipse environment, see <http://www.vogella.de/articles/EclipsePlugin/article.html#deployplugin>

Interesante, pero aun falta el tabulado, o sea, el orden del texto cuando programas

Thanks, great plugin! Any chance the plugin can be added to the Eclipse or Yoxos Marketplace? (i.e. Install by going clicking Help -> Eclipse Marketplace Search for "matclipse")

I am having issues with this installation on a Mac from the update site. When I get to the install, it progresses about halfway through then gives up and me the following error:

"An error occurred while collecting items to be installed session context was:(profile=epp.package.cpp, phase=org.eclipse.equinox.internal.p2.engine.phases.Collect, operand=, action=). No repository found containing: osgi.bundle,net.java.dev.jna,3.5.2"

Any thoughts/solutions?

Thanks
